

1. Attach the 1-1 drawing to the wall with some tape and drill the holes through the drawing in the wall.

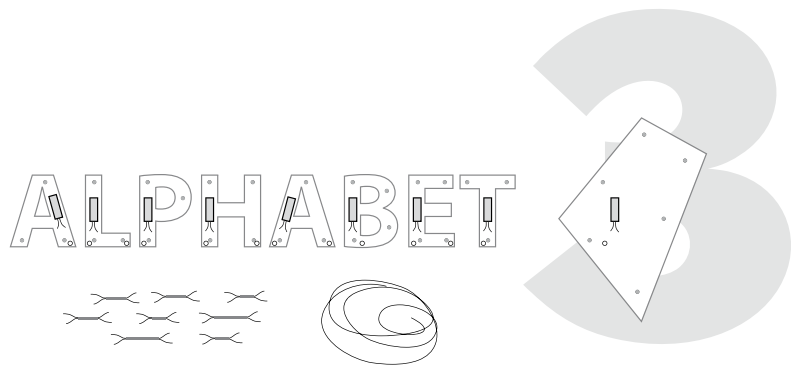

2. Attach the sign-backplates to the wall.

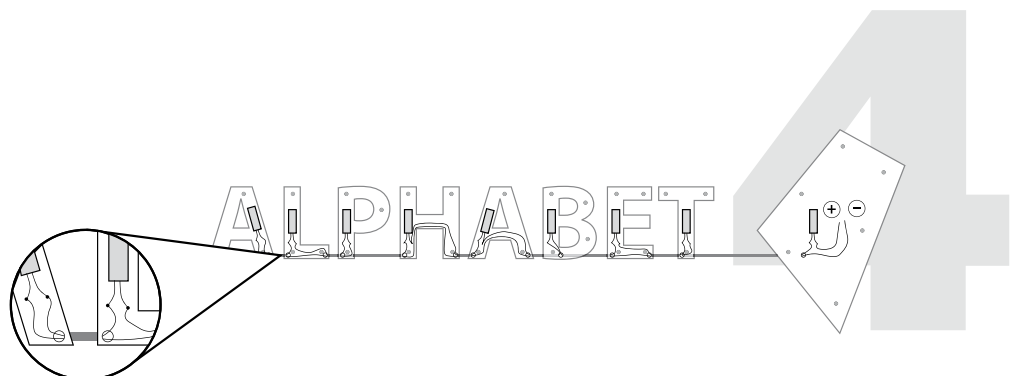

3. If all sign-backplates are mounted, collect the wire-canals and the wire.

Attach the wire-canal at the back, between the signs.

4. Connect every transformer to the wires according to the electrical drawing.

5. Connect the front of the sign with the LEDs to the transformer, place the front at the right position and screw the front of the sign to the backplate with the small screws.

6. If you are finished, put the power on and see what we have made...!

Best use: Turn the sign on just 1 hour before sundown and turn it off when everybody is asleep. During the winter-period you can turn the sign on at 6 AM and turn it off around 9 AM. With this rhythm the sign will last years longer.

Maintenance: Just clean the sign every year with a soft towel and some water.
